% recorded 200 spills or more	0%	0%	0%	0%	0.29%	0%	0%	0.04%	0%	0.05%	**-**	**0.04%**

Table 5: 2025 Storm Overflow Spill Reasons Please note these metrics are in development. In 2025 there is some inconsistency in approach by different Water & Sewerage Companies	Anglian Water (AWS)	Dwr Cymru Welsh Water (DC/WW) (in England)	Northumbrian Water (NW)	Severn Trent Water (SvT)	South West Water (SWW)	Southern Water (SW)	Thames Water (TW)	United Utilities (UU)	Wessex Water (WSSX)	Yorkshire Water (YWS)	Water Company Total	Water Company Average
Number of monitored storm overflows that spilled >30 in one year	145	37	336	379	552	186	108	775	294	670	**3,482**	**-**
Of those that spilled over SOAF thresholds of >30x in one year, % with a reason provided	100%	100%	100%	100%	100%	100%	100%	100%	100%	100%	**-**	**100%**
Of those that spilled over SOAF thresholds of >30x in one year, what % due to exceptional rainfall throughout the year?	0%	0%	0%	0%	0%	0%	0%	5.3%	0%	0%	**-**	**1.2%**
Of those that spilled over SOAF thresholds of >30x in one year, what % due to other operational (incl. asset maintenance)?	34.5%	0%	19.3%	7.9%	35.9%	47.3%	70.4%	12.5%	0.3%	11.2%	**-**	**19.5%**
Of those that spilled over SOAF thresholds of >30x in one year, what % due to hydraulic capacity reasons?	47%	0%	78.3%	92.1%	37.3%	52.7%	26.9%	82.2%	0%	88.4%	**-**	**64.4%**
Of those that spilled over SOAF thresholds of >30x in one year, what % Not Applicable - Ongoing Investigation for primary reason?	18.6%	100%	2.4%	0%	26.8%	0%	2.8%	0%	99.7%	0.4%	**-**	**14.9%**

Storm overflows are permitted to operate due to rainfall and/or snowmelt. The root cause for high spill frequency can be attributed to three main reasons over and above response to typical rainfall. These are fully defined in the Storm Overflow Assessment Framework (SOAF) and summarised below.

Exceptional rainfall: This does not refer to individual rainfall events, but rather the rainfall across the reporting year. Two datasets can be used to determine whether rainfall in the reporting year was "exceptional" or not (over & above typical rainfall) – (1) Environment Agency water situation reports or (2) local rainfall records.

If rainfall was exceptional and deemed the primary reason for high spill count then this is indicated in the annual return (Column W).

Asset Maintenance: Where the asset (storm overflow) and potentially parts of the upstream & downstream sewer network have not operated as designed/expected, high spill counts (over 30 times per year) can be caused.

If asset maintenance is deemed the primary reason for high spill count this is indicated in the annual return (column W). The different asset maintenance categories are listed in the EDM dataset README guide Appendix A.

Hydraulic capacity: If the reason for a high spilling storm overflow (over 30 times per year) is neither "exceptional rainfall" nor "asset maintenance" then the reason is classified under the "Hydraulic capacity" category.

This indicates there is insufficient capacity (conveyance or storage) in the sewer network to cope with the wastewater flow plus typical rainfall entering the sewer network.
